### Bayesian Models For Categorical Data

Bayesian Models for Categorical Data continues to build upon this foundation by developing their application to categorical, or discrete data - one of the most common types of data available. The author's clear and logical approach makes the book accessible to a wide range of students and practitioners, including those dealing with categorical data in medicine, sociology, psychology and epidemiology.

### Bayesian Inference for Categorical Data Analysis

One possible Bayesian approach to estimation for multivariate categorical data is to combine inferences over a set of possible models, weighted by posterior model probabilities. In many examples, it is appropriate to use a standard class of models, for example log-linear interaction models, or graphical models.

The coefficients  $\lambda$  can be interpreted in terms of Empirical Bayes model. In this case we first we fit the marginal distribution  $p(y)$ , that is we find the posterior distribution based on the entire data set. Then we can use this posterior distribution as a prior distribution for the model  $p(y|c)$ , that is the distribution of the target variable given the value of the categorical variable.

This is essentially an addendum to the previous post where I simulated data from multiple RCTs to explore an analytic method to pool data across different studies. In that post, I used the nlme package to conduct a meta-analysis based on individual level data of 12 studies. Here, I am presenting an alternative hierarchical modeling approach that uses the Bayesian package rstan.
