Abstract: Abstract: The control system of a modern engine is responsible for maintaining performance at its optimum while at the same time keeping the engine from exceeding certain emission limits. The control system performs this function using three groups of components: sensors, processor, and actuators. Basic control system configurations are the open and the closed loop systems.

An engine control unit, also commonly called an engine control module or powertrain control module, is a type of electronic control unit that controls a series of actuators on an internal combustion engine to ensure optimal engine performance. It does this by reading values from a multitude of sensors within the engine bay, interpreting the data using multidimensional performance maps, and adjusting the engine actuators.
