Geophysics for Petroleum Engineers 2.9.4 Stratigraphic Traps The second major class of oil trap in petroleum geology is the stratigraphic trap. It is related to sediment deposition or erosion and is bounded on one or more sides by zones of low permeability. Because tectonics ultimately controls deposition and erosion; however, few stratigraphic ...

Summary In modern exploration for oil and gas, geophysics is a key to success, particularly in offshore and frontier areas. Contemporary geophysics (seismic) provides the necessary technology to remote-sense the target to reduce the exploration drilling risk. Seismic also plays a significant role in reservoir characterization and development.

Geophysics for Geologists and Petroleum Engineers

Student studying geophysics typically specialize in an area such as seismology, oceanography or volcanology. Geophysicists work on field-based research projects that require very sophisticated lab analyses or high levels of computation, as well as the use of electron microscopes, mass spectrometers, and supercomputers, among other tools.
